

sensepc.com Website Audit and Growth Report

Executive summary

sensepc.com positions itself around **cloud desktops / virtual desktops** (Desktop-as-a-Service) rather than a traditional “PC builder” or local IT storefront, and the closest mainstream comparators are **Windows 365** and **Amazon WorkSpaces** (plus enterprise brokers such as **Citrix DaaS**). ¹

A key technical blocker for this review is that, in this environment, the **site could not be rendered or text-extracted** (the crawler returned no readable document lines for the homepage). That typically indicates a **JavaScript-rendered site** (SPA) without reliably accessible server-rendered HTML, or anti-bot delivery that prevents automated fetching. This has direct consequences for **SEO (indexing), accessibility, and performance diagnostics**, and it also constrained the ability to quote exact headings, CTAs, and copy from most pages. ²

Despite those constraints, several high-confidence conclusions and actions still stand:

- **Treat “renderability + indexability” as a top-priority risk.** If primary content is not present in initial HTML, search engines and accessibility tools may struggle; your marketing pages should be SSR/pre-rendered and readable without client-side execution (at least for key sections and metadata). ²
- **Pricing clarity and conversion flow** are competitive differentiators in DaaS. Competitors present highly structured pricing tables and predictable plans (e.g., Windows 365’s per-user/month table; WorkSpaces highlights monthly vs hourly metering). ³
- **A stronger “why us” story** (trust, security, compliance, latency footprint, support SLAs, onboarding) is required to compete in this category, where buyers compare *risk* as much as *specs*. Competitor pricing pages explicitly frame cost control and flexibility; you should mirror that narrative and strengthen proof. ⁴
- **Immediate roadmap:** (1) ensure crawlable/SSR content and basic technical SEO fundamentals, (2) optimise “Plans” and “Get started” funnel, (3) build an education moat (use cases + comparison + FAQs), (4) instrument analytics and conversion tracking (GA4/GTM + events) and iterate.

Assumptions (explicit): competitors were selected in the DaaS / Cloud PC space due to the brand’s implied offering and public trademark classification describing SaaS for virtual desktops/cloud storage/file management. ⁵

Research approach and data sources

This report combined:

- Direct attempts to crawl and open key URLs on sensepc.com (homepage and key pages). The homepage was not readable in this environment (no extracted text). ²
- Secondary, primary-publisher references for the competitive set, focusing on *pricing presentation and packaging*, because conversion and plan clarity are core buying-criteria in DaaS. ⁴

- Policy and tooling references relevant to the requested audit scope (e.g., the **Mobile Friendly Test was retired**; therefore mobile checks should use Lighthouse/PSI and real-user CWW signals instead). ⁶
- Industry-standard performance tooling references (PageSpeed Insights API documentation) for how to programmatically collect Lighthouse/field metrics when access is available. ⁷

Constraints and what it affects:

- Because the site HTML could not be extracted here, **page-by-page copy, heading structure, internal links, structured data, canonical tags, and on-page accessibility** could not be verified directly from the rendered pages. ²
- “Primary sources” like Google PageSpeed Insights (shareable report URLs), Lighthouse exports, W3C validator output, robots.txt, and sitemap.xml require direct fetchable URLs; they are not available in this session for sensepc.com. Where unavailable, the report provides **implementation-ready recommendations and templates** that you can validate locally. ⁷

Current site structure and information architecture

Observed URL hierarchy and likely key pages

Based on attempted crawling patterns and typical SaaS site architecture (and the scope you requested), the site *should* expose at minimum the following page types:

- Home (root)
- About
- Product or Services (Cloud Desktop / Cloud PC plans)
- Contact
- Blog / News / Tutorials
- Pricing
- Support / FAQ
- Legal (Terms, Privacy, Cookies)

However, because the homepage was not text-extractable in this environment, the **full list of indexable URLs and internal linking pathways cannot be confirmed** here. ²

Mermaid diagram: current plausible sitemap model

The diagram below reflects the *intended* structure implied by the scope and standard SaaS practice; treat it as a working hypothesis to validate against your actual navigation / sitemap export.

Information architecture and navigation risks

If sensepc.com is primarily client-rendered (as the crawler behaviour suggests), there are three IA risks that commonly appear:

1. **Navigation exists visually but is not consistently discoverable to crawlers** (links may be injected after JS executes), which weakens index coverage and internal PageRank flow. ²
2. **Deep pages are “orphaned” from search:** pricing, support and legal pages often become accessible only through footer components that are also JS-injected.
3. **Sitemap/robots governance becomes critical:** in JS apps, a clean sitemap.xml can compensate for weaker crawl discovery—if it is accessible and maintained.

Because robots.txt and sitemap.xml could not be fetched in this environment, confirm quickly on your side whether: - robots.txt exists and links to sitemap.xml - sitemap.xml (or sitemap index) lists canonical, 200-status URLs for all marketing pages and major product flows

Content, UX and accessibility review

Messaging clarity and value proposition

In DaaS, the minimum “above the fold” messaging that converts usually includes:

- **Who it is for** (remote teams, contractors, students, creatives, developers)
- **What you get** (a Windows Cloud PC / cloud desktop you can access from anywhere)
- **Why it’s safe** (security posture and admin controls)
- **Why it’s better** (cost predictability, performance, setup speed, support)

Competitors explicitly surface plan structure and the promise of budget predictability and flexibility on pricing pages (which function as both product documentation and conversion drivers). For example, Amazon WorkSpaces frames pricing as “flexible and cost-effective” and highlights subscription vs hourly metering. ⁸

Windows 365 pricing pages are extremely literal: a specs table (vCPU/RAM/storage) with monthly subscription rows—this reduces buyer uncertainty at the point of decision. ⁹

Recommendation: ensure your homepage hero and the first scroll deliver the same clarity and reassurance, with a “Start trial / Get a Cloud PC” CTA and a secondary “See plans” CTA.

Calls-to-action and conversion flow

Because the site could not be rendered here, CTAs cannot be enumerated, but the recommended conversion flow for this category is stable:

- Primary CTA: **Get started** (plan selection → account creation → provisioning)
- Secondary CTA: **See pricing** (transparent plan table)
- Trust CTA: **Security & compliance** (policies, encryption, data region, SSO/MFA, audit logs)
- Support CTA: **Talk to sales / contact specialist** for business buyers (mirroring WorkSpaces' "Contact a specialist"). ⁸

Visual design and UX heuristics

Without page rendering, visual critique is necessarily indirect, but you can still validate these high-impact UX patterns immediately:

- **Plan comparison layout:** table + "recommended" plan badge + clear monthly cost + included features + add-ons.
- **Reduced cognitive load:** in DaaS, too many hardware-like spec options without "good/better/best" framing increases drop-off; consider 3–5 curated tiers.
- **Onboarding reassurance:** provisioning time expectations, what device you need, and "what happens after purchase".

Accessibility (WCAG basics)

Given the likely JS dependency observed, prioritise two accessibility angles:

- **Semantic HTML and headings:** ensure a single H1 per page and logical heading order, because screen readers and SEO both rely on it.
- **Keyboard navigation and focus handling:** SPAs often regress on focus trapping, skip links, and modal behaviour.

Mobile friendliness: note that Google retired the public Mobile Friendly Test and mobile usability report (December 1, 2023 update). Therefore, your audit baseline should be Lighthouse mobile emulation + Core Web Vitals field data (Search Console / CrUX) when available. ¹⁰

Technical SEO, performance and security review

Technical SEO essentials to verify

Because the site could not be parsed, the items below are framed as **must-verify** with your own HTML snapshots or a Lighthouse/PSI export.

Core technical checks:

- **Title tags & meta descriptions** per marketing page (unique, intent-matched).
- **Canonical tags** (especially if you have marketing variants or tracking params).
- **Indexability:** correct use of robots meta and HTTP headers; avoid accidental **noindex** on pricing/support.
- **Structured data:** SoftwareApplication / Product / FAQ schema (if applicable).
- **Robots.txt and sitemap.xml:** must exist, be readable, and list canonical pages.

Programmatic performance measurement: Google's PageSpeed Insights API runs analysis on a URL and returns Lighthouse results and (in some cases) field metrics; it supports mobile vs desktop strategies.

7

On-page SEO and content depth

In DaaS, the highest-value SEO pages tend to be:

- "Cloud PC / Cloud Desktop" landing page targeting non-brand intent
- "Plans & pricing"
- "Use cases" pages (remote work, call centres, dev environments, education)
- "Comparison" pages (vs Windows 365, vs WorkSpaces) with objective differences
- Support/FAQ pages that answer provisioning, latency, security, and licensing questions

The Justia trademark listing associated with SENSEPC explicitly references SaaS for virtual desktops/cloud storage/file management, reinforcing that search intent cluster.

5

Performance and Core Web Vitals

No first-party PSI/Lighthouse numeric scores could be captured here. Nonetheless, the *risk model* is clear: JS-heavy pages frequently accrue large JS payloads and longer main-thread blocking, which pushes down LCP/INP and harms mobile conversion. The PageSpeed Insights tooling is explicitly geared to return "PageSpeed scores... and suggestions" based on Lighthouse audits.

11

Actionable performance checklist (implementation-ready): - Pre-render marketing pages (SSR/SSG) and minimise JS required for first paint. - Optimise and preconnect fonts; avoid layout shifts by reserving dimensions. - Compress hero media and ensure modern image formats where supported. - Add caching headers and consider a CDN for static assets.

Security and HTTPS posture

Direct security header scans (e.g., securityheaders.com output) and certificate transparency queries (crt.sh) were not available for sensepc.com in this session, but these are baseline expectations for a product that sells remote desktops:

- Enforce HTTPS site-wide (HSTS recommended).
- Avoid mixed content (HTTP assets on HTTPS pages).
- Deploy modern security headers (CSP, X-Content-Type-Options, frame protections, Permissions-Policy).
- Publish clear privacy/terms/cookie documentation and cookie controls.

For header coverage, scanners typically check for CSP, HSTS, X-Frame-Options and related modern headers.

12

Competitive positioning and recommendations roadmap

Competitor comparison snapshot

Competitors selected (stable, broadly relevant) and why:

- Microsoft ¹³ : Windows 365 is a mainstream Cloud PC benchmark with highly structured plan tables and a strong enterprise trust posture. ⁹
- Amazon Web Services ¹⁴ : Amazon WorkSpaces is a direct DaaS competitor emphasising flexible billing models and multiple capability categories (DaaS, secure browsers, etc.). ⁸
- Citrix Systems ¹⁵ : Citrix DaaS is an enterprise option frequently purchased via partners and procurement channels; public pricing visibility varies by market, but third-party directories present starting tiers. ¹⁶

Key competitive lessons (grounded in cited pages):

1. **Pricing presentation is a product feature.** Windows 365 enumerates specs and prices in a table that reads like a SKU sheet; it removes ambiguity. ⁹
2. **Billing flexibility is a narrative hook.** WorkSpaces' pricing page foregrounds billing modes (monthly subscription vs hourly metering) and an operational "contact a specialist" path. ⁸
3. **Tier naming and packaging matter.** Citrix DaaS is commonly communicated in tier ladders (Standard → Premium Plus), even when detail is thin, which signals segmentation by needs. ¹⁶

Prioritised action list with effort and impact

Priority	Recommendation	Why it matters	Effort	Impact
P0	Make marketing pages reliably SSR/SSG and crawlable , with meaningful HTML on first response	Your homepage was not readable in this environment; this is a direct SEO + accessibility + UX risk. ²	High	High
P0	Create a Pricing page with a clear plan table, "included" bullets, and a single primary CTA per tier	Competitors win by reducing buyer uncertainty. ³	Medium	High
P0	Add measurement: GA4 + GTM , events for plan selection, checkout start, account creation, contact submit	Without tracking, optimisation is guesswork; assume no backend access.	Medium	High
P1	Build a "Security & Trust" page (encryption, MFA/SSO, data handling, uptime, backups, support SLA)	DaaS buyers require reassurance; WorkSpaces explicitly supports sales escalation. ⁸	Medium	High

Priority	Recommendation	Why it matters	Effort	Impact
P1	Publish Use cases pages and comparison pages	Matches non-brand search intent; supports evaluation journeys. ⁵	Medium	Medium-High
P1	Implement technical SEO baseline: canonical, sitemap, robots, structured data	Crawl and snippet quality, plus SERP eligibility. ⁷	Medium	Medium-High
P2	Expand Support/FAQ with provisioning, device requirements, latency expectations, refunds	Reduces support tickets and increases conversion.	Low-Medium	Medium
P2	Performance optimisation sprint (LCP/INP/CLS, image + JS budgets) via Lighthouse/PSI	Improves conversion; PSI provides audit guidance. ¹¹	Medium	Medium

Suggested copy changes and wireframe-level improvements

Homepage (hero) suggested copy (example): - H1: "A secure Cloud Desktop you can access from any device" - Subhead: "Provision a high-performance Windows desktop in minutes for work, study, or development—without buying new hardware." - Primary CTA: "See plans" - Secondary CTA: "Talk to us"

Pricing tier labels (example): - Starter (email, browsing, admin) - Pro (development and multitasking) - Performance (power users, heavier workflows)

Trust strip (above the fold): - "Encrypted connections" - "Multi-device access" - "Transparent monthly pricing" - "Human support"

These suggestions are aligned with the conversion framing used by competitors: cost control, flexibility, and clarity. ⁴

Table: current vs recommended metadata for key pages

Because page HTML could not be extracted, “current” metadata is unknown here (except the homepage title surfaced in crawl attempts). Validate and replace the “current” column with an export from your CMS/router once available. ²

Page	Current title tag	Recommended title tag (≤60 chars)	Current meta description	Recommended meta description (≤155 chars)
Home	“Cloud Desktop with Sense PC Flexible Computing Power” ²	Cloud Desktop Secure Cloud PC in Minutes	Unknown	Secure cloud desktops for work and study. Choose a plan, deploy fast, and access from any device.
About	Unknown	About Why SensePC	Unknown	Learn who we are, what we build, and how we deliver secure cloud desktops with reliable support.
Plans & Pricing	Unknown	Pricing Cloud Desktop Plans	Unknown	Transparent cloud desktop pricing. Compare CPU, RAM and storage tiers. Cancel anytime.
Product page	Unknown	Cloud Desktop High-Performance Cloud PC	Unknown	Run apps and workflows in a secure cloud desktop—fast provisioning, encrypted access, flexible plans.
Tutorials / Blog	Unknown	Guides Cloud Desktop Setup & Tips	Unknown	Tutorials on setup, security, performance, and best practices for using cloud desktops.

Page	Current title tag	Recommended title tag (≤60 chars)	Current meta description	Recommended meta description (≤155 chars)
Support / FAQ	Unknown	Support Cloud Desktop Help & FAQ	Unknown	Answers on provisioning, login, billing, security, backups, and troubleshooting. Contact support.
Contact	Unknown	Contact Sales and Support	Unknown	Talk to sales or support. Get help choosing a plan, onboarding users, or resolving issues.
Privacy	Unknown	Privacy Policy	Unknown	How we collect, use, and protect personal data.
Terms	Unknown	Terms of Service	Unknown	Terms governing use of the platform, billing, refunds, and acceptable use.

New page templates and content outlines

Plans & Pricing template - Hero: "Choose your Cloud Desktop" - Plan table: tiers × specs (vCPU/RAM/Storage) + included features - Add-ons: extra storage, static IP, backups, GPU (if offered) - Trust: uptime, support hours, refunds - FAQ: billing cadence, cancellation, setup time - CTA: "Start now" per tier + "Contact sales"

Security & Trust template - Authentication: MFA/SSO options - Data handling: encryption in transit/at rest, backups, retention - Compliance posture: what you support today; what's planned - Operational reliability: status page link, incident comms approach - FAQ: "Can admins control access?", "Where is data stored?"

Use case template (repeatable) - Persona (e.g., remote team, student, developer) - Problem → solution narrative - Recommended plan - Setup steps - Proof: testimonials, case studies, screenshots

30/60/90 day implementation roadmap

Timeframe	Objectives	Deliverables
30 days	Fix discoverability + measurement foundations	SSR/SSG for marketing pages; indexable metadata; basic sitemap/robots; GA4+GTM with core events; draft pricing table IA. ¹⁷
60 days	Ship conversion upgrades + trust layer	Public Plans & Pricing page; Security & Trust page; improved onboarding funnel; Support/FAQ expansion; first performance pass using Lighthouse/PSI workflow. ¹⁸

Timeframe	Objectives	Deliverables
90 days	Build demand capture + competitive moat	Use case library (3–6 pages); comparison pages; tutorial cadence; structured data for FAQ/product; iterative CRO based on funnel data. ¹⁹
